Golden Mortgage Lifter Corn

The Corn Grown for Profit.

What we have claimed for this corn in former years has been verified the past season. No corn has given better satisfaction or yielded better grain than this justly celebrated variety. This wonderful variety, first introduced in 1893, has gained great favor among the corn growers everywhere. The large amount of corn produced on so small a cob surprises everyone. Golden Mortgage Lifter is what all farmers have been seeking. It is nearly all grain—but very little cob. It is early. It is prolific. It has strong, stiff stalks and stands up well. It will outyield any other early corn. It has the smallest cob of any large grain. It is rich in oil. It will fatten faster than any corn grown. It suits the grain dealer and tops the market. It takes first prize wherever shown. The best up-to-date 100 day corn in existence. Its broad, closely set leaves makes it a valuable ensilage and fodder corn. It will please any farmer and is the corn they want. The average weight of cob per bushel of corn of this variety is $7\frac{1}{2}$ pounds, thus shelling about 90 per cent. of grain. Should every farmer plant this variety of corn there would be a great increase in yield of corn in this country in a single year. We want every farmer to plant this corn and have put the price within reach of all. Seed is very carefully selected, shelled and graded. Sacks free.

RIED'S YELLOW DENT

Without a Rival—An All-Purpose Corn of a Light Golden Color.

The ears are 8 to 11 inches long, 7 to 8 inches in circumference 18 to 24 rows of kernels, each row containing 50 to 60 kernels. Ears are cylindrical from butt to tip. The cob carries a large amount of grain, shelling .88 per cent. of grains and often better. The butt tips are particularly well filled. The ears of this variety are remarkably uniform. In this respect it is remarkably superior to all other corn. The kernels are medium in thickness, blunt wedge shape, setting very closely together, no lost space between the rows. The cob is red, medium to small, small shank, and easy to husk. This variety is a vigorous grower, with stalks 8 to 12 feet high, heavy below the ears,

Reid's Yellow Dent

moderate above and does not blow down easily. It has an abundance of foliage. This makes it an excellent fodder and ensilage plant, producing a heavy tonage to the acre. When cut up and put in the shock it cures completely, retaining its natural color, becoming the very best of the fodder. By careful selection, elimination of barren stalks, this corn has been so improved that a yield of 90 to 100 bushels an acre can be grown on good soil carefully managed; it is bred to a medium rough type, an early husker and safe from frost in 115 days.

Boone County White

The Best White Corn.

This famous corn is the most valuable variety for planting in the central and southern corn belt. It is noted for its records of high yield that has never been surpassed by any other variety. The ears are extra large size, measuring eight to twelve inches in length and $7\frac{1}{2}$ to $8\frac{1}{2}$ inches in circumference and has 18 to 26 rows of kernels. The cob is medium to large and pure white in color. We find the Boone County White superior to all others on account of its pure quality and large yield. The butts and tips of this variety are exceptionally well filled. The ears are of uniform appearance, shape and size. The kernels are pearly white, moderately rough, very deep, with fine, large germs. The great depth of kernels always insures a large percentage of shelled corn. The conformation of stalk is very effective in withstanding the destructive effect of high winds, being exceedingly large and stiff from the ear to the ground. The rooting system is extensive, affording great facilities gathering plant food. The foliage is abundant, leaves broad, thick succulent, affording excellent ensilage or fodder. The number of unproductive and weak stalks have been reduced to the minimum and the average size of the ears increased to the maximum. This variety matures in from 110 to 120 days. The seed is carefully hand picked, stored, selected, shelled and graded.

Pride of the North

85 Day Yellow

This variety originated in Iowa. It is the best early dent corn grown. Strong, hardy, vigorous grower from the start, and makes a crop if planted by July 4th. The ears are medium small, kernels deep, and cob bright red. Fully twenty-five per cent. of the stalks have two good ears. It is excellent for early feeding, and can be planted thickly and still make full-sized ears. Ripens earlier, dries out quicker, makes better fodder, stands drouth better, and will yield more number one corn to the acre than any other variety, and bring the most money in the market. This variety is especially adapted to high altitudes, and will mature further north than any other Dent corn. Extensively grown in northern Illinois, Iowa or Minnesota, Wisconsin, Michigan and the Dakotas. This corn is especially priced for seed, carefully hand selected, tipped and butted, shelled and graded.
